

The annular seals are made of a metal ring machined. **They are designed for applications at high temperatures and high pressures and are always used in combination with special flanges fitted with milled grooves.**

The annular seals can be used in **very high pressures and / or fluctuating according to the profile selected.** The choice of material determines the performance with respect to temperatures (up to 100 ° C) and aggressive media.

Propriétés :

Usage:

In the chemical, petrochemical, nuclear, food, cosmetics, pharmaceutical

Avantages :

Under the effect of tightening the seal deforms and fills the surface irregularities of the throat. As the area supporting the effort are very small, the bearing pressure is obtained and used to quench elevated very high pressures

Médias d'applications :

We reserve the right to modify our products and ranges at any time to improve them.
